Дополнительные сведения. Disk ImageQ: Why can I "change" a private property of a derived class? I noticed that I can "change" a private property of a derived class. For example, abstract class Base { protected string \$simpleProperty; private function \_\_construct() { \$this->simpleProperty = "I am a simple object"; } } class Derived extends Base { private function \_\_construct() { \$this->simpleProperty = "A simple object!"; } } Does that have to do something with PHP magic, or does this mean that derived classes can have their own private functions (as long as they are not calling the parent constructor)? A: All classes are magical in some sense. Therefore, inheritance is implicitly magic, too. All classes can add things to each other. It is a very bad practice to use inheritance as an OO tool. Using inheritance this way makes your classes like the name of the parent class + "Component". Instead, use composition. If you don't want this, you should not inherit from the parent class. Clarification: A previous version of this story incorrectly stated that San Francisco is the only city that borders Oregon. The city is a city that borders both Oregon and California. San Francisco is breaking out its surfing gear and creating new rules to try and combat the tourist onslaught. The City's Planning Department released a document Tuesday that contains how hotels, motels, hostels and vacation rental properties will have to play by new rules. City officials said residents and tourists will pay for the increased tourism from visitors expected in 2017 from the U.S. Bicentennial and Asian Games and Expo in South Korea. The increase in tourism is expected to get some significant push ba244e880a
