SystemCare ProV10.3.0.745 [SH].Nuclear DNA content and flow cytometric
DNA analysis of human cutaneous melanomas. Samples of primary cutaneous melanoma from 100 patients were
analyzed by flow cytometry to determine the DNA ploidy and S-phase fraction (SPF) of each tumor. The DNA
ploidy of 45% of the tumors was nondiploid, 43% were diploid, and 12% were tetraploid. A direct comparison of
DNA ploidy and SPF using 5-bromo-2-deoxyuridine labeling revealed that only 23% of the cells in a given tumor
had arrested in the cell cycle. The proportion of S-phase cells in diploid tumors was 7.4% and ranged from 8% to
16% 2d92ce491b
