Forms authentication. As far as I have searched, I have seen some claim that forms authentication can be bypassed by using the browser proxy. Therefore, is my claim true? If so, how can I protect my web app in an effective way? A: Forms authentication in its basic form means the user will be able to authenticate himself by showing the cookie to the server. HTTP basic authentication also means the user will be able to authenticate himself by showing the cookie to the server, so the claim is correct. An attacker could for example use a proxy to get the cookie from the user, but this cookie will only be valid for that request, so this won't be a security flaw. But if you want more security than this, you can also use other methods to authenticate the user, for example IP verification. HIGH POINT, NC --High Point Police officers arrested

Open Autocad and create a new drawing. Go to the File menu, select Export to DWG and press Export. Open the exported DWG file in Microsoft Word and in the Export dialog select Microsoft AutoCAD. Select a location to save the file, and press Open. Press OK. Press Open. Select the C:\users\user\_name\Desktop\file\_name.dwg file and press OK. A message box should appear which says that the file is ready for editing. Press OK. The picture is a typical table and its format is a triangle with green and white triangles. You will not lose the data if you delete the file. You can replace the file with a different one. However, this will render the drawing unusable. Q: How do I load a page in my web application via an aspx page without rendering it? For example, I have a LoadAmsciencesActionPage method: public void LoadAmsciencesActionPage() { Response.Redirect("/Amsciences/ActionPage.aspx"); } If I call this method from my main page, the page is rendered properly. But if I call it from an aspx page, it renders the page in the browser but without the page content. Why is this, and how can I fix it? A: This is because the content of your page is in the client side. The content of the page is loaded when the page is shown in the browser. You need to force your page to render on the server first before it gets sent to the client. This is done by using a response that redirects to the client. To force this, replace your Response.Redirect with Response.Redirect("/Amsciences/ActionPage.aspx", false); Also make sure your redirect to a static HTML page with a minimal content. Or better, replace it with a simple LinkButton that just redirects to the ActionPage.aspx. Court of Appeals of the State of Georgia ATLANTA,\_\_\_\_\_
